

GEORGIA AGRICULTURAL FACTS

1984 EDITION

Georgia Crop Reporting Service

November, 1984

MESSAGE FROM THE COMMISSIONER

Dear Fellow Georgians:

With each passing year, GEORGIA AGRICULTURAL FACTS becomes an even greater resource for the farmer, economist, agribusinessman, journalist and numerous others. As farm numbers decline, and as America becomes more and more an "information" society, the facts contained in this reference serve as valuable evidence of Georgia agricultural progress. GEORGIA AGRICULTURAL FACTS is both photograph and reflection of Georgia farming and farmers, with all the innovations and successes, and unfortunately, the failures -- whether by Man or Nature -- clearly evident.

In many ways, 1983 was a year of extremes for Georgia farmers. The federal Payment-In-Kind program, which paid farmers with commodities to take land out of production, idled more than one million acres in Georgia. Winter and late spring freezes reduced our peach and apple crops substantially, and a prolonged summer drought and heat wave took its toll on poultry and cut yields from a variety of crops and pasture land.

But farmers are a tough and eager lot, and most remained ready to address a new year's challenge. This publication, produced under a cooperative agreement with the Statistical Reporting Service, U. S. Department of Agriculture and published by the Georgia Department of Agriculture, is dedicated to the continued growth and expansion of Georgia's agricultural resources. We trust it will serve you well.

Sincerely,

Tommy Irvin

FOREWORD

Each year Georgia's multi-faceted agricultural industry seems to become more complicated. Certainly, 1983 was no exception as producers continually met new challenges and new obstacles that required additional skills and abilities. Even with good management and planned marketing strategies, many producers found 1983 a less than satisfactory year.

Several major factors impacted the year beginning with huge surpluses of several grain commodities that resulted in the Payment-In-Kind government program. The PIK program forced row crop farmers to make major decisions concerning crop selections and planted acreages. Major reductions in acreage planted resulted for several key crops which had major impact not only for the row crop producers but for the livestock and broiler producers as well. Although growing conditions were not nearly as severe as in the drought stricken mid-western states, yields were only moderate and considerably below the 1982 averages for most crops. Prices received for most crops rebounded somewhat during the year but not sufficiently to prevent a reduction in total net farm income of approximately 50 million dollars from the 1982 level. Many livestock producers found themselves in the unenviable position of depressed livestock prices and much higher feed costs. Although some rays of sunlight could be seen at the end of the tunnel, the continual financial squeeze on Georgia producers has been described as the most severe since the depression of the 1930's.

The Georgia Crop Reporting Service is pleased to present this 1984 edition of Georgia Agricultural Facts. This agency has been a key cog in the information system providing much of the basic statistical data used by producers either directly or indirectly in making their management decisions since the early 1900's. The analysis and interpretation of these basic statistics are performed by others, such as the University of Georgia Extension Specialists, private economists and the producer himself. Our role of providing the basic data is not taken lightly, but every effort within available resources is made to provide an accurate and timely product beginning with survey design and continuing through data collection, summarization, analysis and finally the release of each crop and livestock statistic.

Statistics in this edition are keyed to the 1983 production year and include state and county facts for most major commodities. Estimates prepared by this agency are based on actual surveys that are designed to provide state estimates within a five percent error margin. As a convenience to users, some data series prepared by others are reproduced in this publication with credit to the preparer.

We are continually indebted to thousands of voluntary reporters from the Georgia farming and agribusiness community. Each reporter gives his time and effort to report various information that relates to his farm and business activities. Without this voluntary cooperation it would be impossible to make reliable estimates or compile this publication. Thank you for your continued cooperation and support. Your suggestions for further improvement of this publication will be appreciated.

Sincerely,

Larry E. Snipes
Statistician In Charge

CROPS

CROPS HIGHLIGHTS

Wet soils and low temperatures caused Georgia's 1983 planting season to begin later than usual and to progress slower than normal. Planting progress sputtered through a cold, wet April until record-low temperatures slowed progress to a snail's pace toward the end of the month. May was more favorable for planting but many fields were already planted so late that development stages, including maturity, were reached later than normal. Periods of dry weather during each month of the growing season held most yields to moderate levels. Harvest went slower than usual for several crops even though there were fewer acres to harvest in many cases, due to the "Payment-In-Kind" Program which induced many growers to plant fewer acres of grains and cotton.

SOYBEAN PRODUCTION DOWN

Georgia's 1983 soybean crop was buffeted by unfavorable weather during much of July, August and September. Crop saving rains around the 1st of August and again around the first of September enabled farmers to realize a 21.0 bushel per acre yield. This was well below the 27.0 bushel yield of 1982 and only slightly better than some of the poor years of the 70's and early 80's. Planted acres at 2,050,000 were 15 percent below the record high acreage set in 1982. Harvested acres totaled 2,000,000, down 15 percent from 1982. Despite the disappointing yields, production totaled 42,000,000 bushels for the third largest crop of record. Value of production totaled \$323,400,000 in 1983 also the third highest of record. The record high season average price of \$7.70 was the bright spot of the 1983 soybean crop.

TOBACCO SHRINKAGE CONTINUES

Georgia's tobacco acreage took another step down in 1983 to continue a long term decline which stretches back to 1925. With only 44,000 acres harvested in 1983, the "golden leaf" acreage shrank another 5,000 acres, or 10 percent from the previous year. Average yield, at 2,190 pounds per acre, was slightly better than the 1982 crop, the third best yield ever recorded. Despite the improvement in yield, production fell 9 percent to 96.4 million pounds, making it the smallest crop since 1969. The average price received by growers was a record high \$180.30 per hundred pounds. This was 70 cents over the previous year's price. The overall value of the 1983 crop dropped \$15.9 million, or 8 percent, to total \$173.7 million.

CORN ACRES RECORD LOW

Corn acres in Georgia for 1983 were at the lowest level since records began in 1866. The 830,000 acres planted marked the second time that the State's corn acreage has ever dipped below the million acre mark. The other occurred just a year earlier. Of those 830,000 acres planted for 1983, 735,000 acres were harvested for grain. This, too, was a record low.

Although fewer acres were harvested, yield averaged 75 bushels per acre, which was the second best average yield the State has ever attained. The record high yield of 85 bushels per acre was recorded in 1982. Total production in 1983 was 55.1 million bushels, a 20 percent drop from the previous year. The average price that farmers received for their corn was a record-high \$3.70 per bushel, up more than a dollar per bushel from the year before. The higher price more than offset the decline in production and boosted overall value of the crop to \$204 million, a 12 percent increase.

COTTON ACRES DIP

Cotton acreage in Georgia in 1983 dropped back to a record-tying low of 120,000 acres. Only in 1978, had the State's cotton acreage been that low--on records back to 1866. Part of the acreage reduction in 1983 can be attributed to incentives given for acreage cut-backs under the PIK program. Of the 120,000 acres planted, 115,000 were harvested, which also ties the record low of 1978. The 1983 yield of 467 pounds per acre was far, far below the phenomenal 714 pound record yield obtained in 1982. As a result of the drop in both yield and acres the 1983 crop at 112,000 bales was less than half of the 1982 crop. The overall value of the 1983 crop fell \$27.8 million, or 43 percent, to only \$36.1 million.

WHEAT PRODUCTION PLUMMETS

Wheat production in Georgia had a very rapid retreat in 1983 from the very high levels of the two previous years, including the record high in 1981. Georgia's 1983 wheat crop, at 30.9 million bushels, dropped almost one-third from the 45.2 million produced in 1982. Inducements offered to growers through the PIK program were partially responsible for the acreage reduction. A 34 percent reduction in acres harvested, to 910,000 acres, still ranked the 1983 crop as the third largest ever harvested in the State. Thanks to a slightly stronger yield, at 34 bushels per acre, and a 15 cents rise in average price, to \$3.20 per bushel, the overall value of the 1983 crop declined only 28 percent, to \$99 million.

PEANUT ACRES REBOUND

Following a drop in peanut acres in 1982 to the lowest level in 22 years, the 1983 plantings rebounded 19 percent to total 562,000 acres. Despite that much increase in acreage, total peanut production rose only 3 percent to 1.57 billion pounds as dry weather reduced the average yield to only 2,790 pounds per acre, a drop of 425 pounds per acre from the 1982 yield. Average price also declined by one and one-half cents to 23.1 cents per pound. Value for Georgia's 1983 peanut crop at \$362.2 million made it the State's most valuable crop. Georgia remains unchallenged as the leading peanut state in the Nation.

FRUITS AND NUTS

HIGHLIGHTS

For the second consecutive year, Georgia's fruit crops were damaged by 1983 spring freezes. The first of these damaging freezes occurred in late March when over half of the peach crop was already in bloom. Most of those blooming at that time were in central and south Georgia and damage was somewhat limited. The later freezes, which occurred on April 19 and 20 were not so gentle. Nearly all of the north Georgia peach crop was killed, as well as part of the apple crop which was blooming freely by that time. Pecans bloom so late that they rarely have freeze loss but the record cold temperatures that late in April caught some pecans in east-central Georgia in bloom and they were lost. Some observers claimed additional reduction in other areas from poor pollination that resulted from the freeze. As a result of the limited peach and apple production, both in Georgia and nearby states, prices were more favorable for that fruit which did survive. The harvesting season for fruits progressed at a rate which was very close to the 5-year average progress. Pecan harvest was a different story. Harvest began slightly later and progressed much slower than usual.

PECAN CROP DOWN

For the first time in four years, Georgia's pecan crop showed a drop in production from the previous year. The same factors that had contributed to increased production for the three prior years were also present in the fourth year. Those factors included continuing improvements in management, cultivational practices, especially the expansion of irrigation capability, and also the expansion of bearing surface as young trees came into production. The main difference in the fourth year was weather, particularly the late freezes in April. The 20 percent drop in production in 1983 to 100 million pounds was, at least partially, due to damage from those freezes. One commercial area in east-central Georgia had very little production with some sizeable groves having no pecans at all. Despite the 20 percent drop in production, Georgia still led the Nation in pecan production by a wide margin. Georgia's 1983 production accounted for 37 percent of the National total.

Even though the crop was smaller, harvest went much slower than both the previous year and normal due to the exceptionally late spring causing the crop to develop and mature later.

The average price received for the 1983 crop was 62.9 cents per pound, off .8 cent from the 1982 average, but still 7.1 cents above the price received for the 1981 crop. The total value of the 1983 crop amounted to \$62.9 million, 21 percent less than the 1982 crop.

PEACH VALUE RECORD HIGH

Despite those late spring freezes that destroyed the peach crop in northern Georgia and South Carolina, there was a bright spot concerning the 1983 peach crop. Due mainly to the sharply reduced production in the southeastern states as a whole, prices were record high and this more than offset the loss in production and boosted the overall value of the crop to a record level. The value of Georgia's 1983 peach crop totaled \$23.1 million, 3 percent above the 1982 crop which was also reduced in the north by freezes. The previous record value was set in 1975 and totaled \$22.6 million. Utilized production in 1983 was 92 million pounds, the lowest since 1977 and 18 million pounds below the 1982 crop which was also freeze damaged. With production off so sharply in Georgia and neighboring states, the average price jumped to a record high 25.1 cents per pound. The previous record price was set in 1975 and averaged 23.8 cents per pound.

APPLES UP 36 PERCENT

Georgia's 1983 apple crop was hurt by spring freezes, but not as severely as the freeze damage on the 1982 crop.

Utilized production of Georgia apples in 1983 was 19.0 million pounds, up 36 percent from the 1982 crop which suffered freeze damage that reduced that apple crop to only 14.0 million pounds. Of the 19 million pounds produced in 1983, over half, or 10 million pounds, of the apples came from northern orchards and 9 million from the south. The total crop value at \$1.6 million was also up 8 percent from the 1982 crop. The price per pound for apples during 1983 averaged 11.5 cents per pound in the north and 3.5 cents per pound in the south, for a statewide price of 8.6 cents per pound. This was a 20 percent or 2.2 cents per pound drop in prices. These average prices include both fresh market and processing apples.

GRAPE PRODUCTION OFF

Late spring freezes reduced the production potential for grapes in 1983, just as it did for other fruits. Utilized production in 1983 totaled 2,300 tons, a 12 percent decrease from the 1982 crop. Income received from grape marketings, considering both fresh market and processing, gave an average price of \$534.00 per ton, an increase of \$61.00 per ton from the previous year and established a record high grape price for the State. Even with the sharply higher prices, overall value of the crop, at \$1.2 million, was down slightly from last year due to the smaller production.

Additional plantings of grapes occurred during 1983 in response to Legislative action in 1982 which has allowed the establishment of several new wineries.

POULTRY

POULTRY HIGHLIGHTS

The production of commercial broilers in Georgia hit a record high in 1983. The number sold, pounds sold and gross income were all at record high levels. The price per pound, at 27.0 cents, was the highest price since 1980. However, total egg production was the lowest since 1966 with commercial egg production the lowest since 1965. The average number of all layers on hand was the lowest since 1965. The total number of spent hens sold for slaughter was the lowest since 1968. The decrease in the size of the commercial egg producing flock was caused by a number of factors. The number of producers and the size of flocks have been decreasing since 1979.

The number of hens being molted and the number completing a forced molt was the largest number on record. The prices for broilers, all eggs and spent hens were all above 1982. The gross income for all chickens and eggs in 1983 was 5 percent above the 1982 level. Turkeys recorded a decrease in numbers raised, pounds sold, price and gross income with the latter 5 percent below 1982.

The gross income from all chickens and eggs including broilers amounted to \$971.6 million for the 1983 production year, up \$46.6 million from 1982. Georgia still ranks first in the Nation in gross income from all chickens and eggs including broilers, excluding turkeys. The State ranked below only California in earnings from eggs and was second to Arkansas in earnings from broilers. Gross income from broilers produced in Georgia during 1983 totaled \$676.7 million, up 3 percent from the \$610.7 million in 1982. Even with the 4.5 cents per dozen increase in price for eggs, the decrease in total production caused a 7 percent reduction in cash receipts in 1983 compared with 1982.

BROILER PRODUCTION UP

Georgia produced about 15 percent of the Nation's broilers in 1983. Production was 626.6 million birds during the marketing year, December 1, 1982-November 30, 1983, up 3 percent from the 610.7 million produced the previous year. Georgia produced 2.5 billion pounds of broilers in 1983, compared with 2.4 billion pounds a year earlier.

The number of spent fowl sold from Georgia's laying flocks in 1983 totaled 18 million, down from the 21.4 million sold the previous year. A total of 644.6 million spent hens and broilers were sold for slaughter in 1983, up 2 percent from 1982.

Prices in 1983 averaged 27.0 cents per pound for broilers, compared with 25.0 cents per pound in 1982. The average price for spent hens was 16 cents per pound, 4 cents more than in 1982.

EGG PRODUCTION DOWN

Georgia's egg production during the year ending November 30, 1983, totaled 4.7 billion eggs. This was 13 percent less than the 5.4 billion produced in 1982. During 1983, the average number of layers was 19.2 million or 2.9 million below the 22.1 million during 1982. The average number of layers in hatching egg flocks during 1983 was 5.1 million, 7 percent less than 1982. The average number of layers in other flocks was 14.1 million, down 15 percent from 1982. Georgia's layers produced an average of 243 eggs in 1983, unchanged from 1982. Hatching egg producers sold 1.1 billion eggs during 1983 of which 69 million were sold as commercial eggs and 1 billion for hatching eggs. Producers of table eggs sold 3.5 billion eggs during 1983 bringing the total eggs sold to 4.7 billion.

The sale of commercial eggs was 65 percent of the total cash receipts from eggs in 1983 while hatching eggs made up the other 35 percent. The average price per dozen for all eggs during the 1983 marketing year was 71.7 cents. This was 4.5 cents more than the 1982 average price. Commercial eggs brought 5.4 cents more per dozen in 1983 than in 1982, and hatching eggs brought 3.1 cents per dozen less.

TURKEY CROP DECLINES

During 1983, Georgia's turkey producers raised 2.3 million poult, down 15 percent from the 2.7 million raised in 1982, and down 17 percent from the record level of 2.7 million in 1981. Only heavy breed turkeys are raised in Georgia. Turkey production in 1983 totaled 60.3 million pounds live weight, 3 percent below the 1982 level.

The value of Georgia's 1983 turkeys decreased to \$24.1 million from \$25.5 million in 1982. The decrease in total value was due to lower prices, and fewer pounds sold. The live weight price in 1983 was 40 cents per pound, down from 41 cents in 1982.

1/ Queen bees sold individually. 2/ A queen bee included in each package. 3/ Estimates not made in 1982.

LIVESTOCK AND DAIRY

LIVESTOCK HIGHLIGHTS

Georgia's livestock inventory at the end of 1983 was below the previous year for both cattle and hogs. Cattle numbers dropped for the second year in a row and hog inventory decreased for the fourth consecutive year. Despite the drop in inventory numbers in 1983, prices for both cattle and hogs failed to improve. Cattle averaged \$46.00 per cwt., unchanged from 1982 and hogs averaged \$45.90 per cwt. compared to \$51.90 in 1982. However, prices for calves were up \$1.50 per cwt., averaging \$54.60 in 1983.

Georgia ranked 25th nationally in the number of cattle and calves and 11th in hogs and pigs at the end of 1983. The number of hog farms in Georgia, at 14,600 in 1983, was down 1,400 from the previous year and cattle farms dropped 2,000 to 38,000. The number of farms with milk cows averaged 2,700 in 1983, 200 less than the number of farms with milk cows in 1982. Cash receipts for dairymen and livestock producers totaled \$674.1 million for 1983, down 2 percent from the previous year.

CATTLE

All cattle and calves on Georgia farms as of January 1, 1984, totaled 1,725,000, an 8 percent drop from the previous year's total of 1,875,000 head. Cash receipts from the sale of cattle and calves in 1983, at \$254.4 million, were up 5 percent. This remains the third highest total on record, exceeded only by the \$258.9 million in 1978 and the \$309.3 million in 1979. The increase in cash receipts resulted from a higher average price for calves and larger marketings.

The January 1, 1984 inventory value of all cattle and calves on Georgia farms was set at \$543.4 million, a decrease of 16 percent from the previous year. The average value per head for all cattle and calves was \$315 compared to \$345 in 1983.

The 1983 calf crop totaled 780,000 head, down 7 percent from last year's calf crop of 840,000 head. Mitchell County took over the lead in number of cattle and calves with 32,000, followed by Colquitt and Morgan Counties with 31,500.

HOGS

The inventory of all hogs and pigs on Georgia farms as of December 1, 1983, was estimated at 1,310,000 head, 6 percent below the previous year. This was the lowest December 1 estimate since 1975. Breeding stock decreased 14 percent from the preceding year to 186,000, while market hogs were 5 percent less at 1,124,000. Cash receipts for hogs were down 11 percent from 1982 to \$219.6 million, as a result of the decrease in average price per cwt. The average value of hogs and pigs on hand December 1, 1983, plummeted to \$54.50 per head, compared to \$89.00 per head the preceding year. The total value of the hog inventory on that date was \$71.4 million compared to \$124.6 million a year earlier.

Georgia pork producers had 291,000 sows to farrow from December 1, 1982 through November 30, 1983, compared to 294,000 sows farrowing the same period a year earlier. The total pigs saved during this same period was 2,067,000, which resulted in an average of 7.1 pigs per litter. Colquitt County, with 58,000 head, continues to be the leading county in total hogs and pigs.

MILK PRODUCTION

Georgia dairies produced an estimated 1,395 million pounds of milk during 1983, 1 percent less than last year. The annual average number of milk cows on farms was 129,000 in 1983, compared to 130,000 in 1982. Milk produced per cow averaged 10,814 pounds for 1983, slightly less than the 10,862 pounds per cow the previous year. Cash receipts from marketings at \$200.1 million were \$780,000 less than 1982. Morgan County led Georgia in the number of milk cows with 9,200, followed closely by Putnam County with 9,100.

RED MEAT PRODUCTION

Slaughter plants in Georgia produced 463 million pounds of red meat (beef, veal, pork and mutton) during 1983, an increase of 7 percent from 1982.

Production of beef was up 1 percent from last year and pork was up 8 percent.

FARM INCOME, PRICES AND EXPENSES

HIGHLIGHTS

Gross farm income for Georgia farmers in 1983, at \$3.68 billion, was up 1 percent from the revised 1982 gross income estimate. Farm production expenses dropped 2 percent from 1982 to \$2.93 billion. This gave a total net farm income estimate, after allowances for changes in inventory values, of \$600.3 million, 8 percent below 1982 and due primarily to the unusually large net reduction in the change in farm inventories. Realized gross income per farm averaged a record high \$66,886, up about 5 percent from the previous record high in 1982. Realized net income per farm averaged \$13,644 up 21 percent from the \$11,270 average of 1982. The average realized gross and net farm income does not take into account the large net reduction in farm inventories.

CASH RECEIPTS

Total cash receipts from farm marketings and government payments rose 1 percent from 1982 to \$3.39 billion. The increase was due entirely to government payments of \$82.2 million which was nearly 3 times the 1982 level. Livestock, livestock products and poultry accounted for 30.3 percent of the 1983 cash receipts while crops accounted for 47.3. Government payments comprised 2.4 percent of the 1983 total. Commercial broilers grossed a record \$676.7 million or 20 percent of the total to again rank as the leading gross sales farm enterprise in Georgia.

Eggs were the fourth most important in total receipts with 8.2 percent of the total or \$278.7 million. Following closely in fifth place was cattle and calves at 7.5 percent of the total or \$254.4 million. Sales from broilers and cattle and calves in 1983 were well above 1982. Egg receipts in 1983 were off sharply from 1982 falling to the lowest level since 1975.

Crop sales totaled \$1.60 billion in 1983, down 2 percent from 1982. Cash receipts from the sale of crops comprised 47.3 percent of the total. Peanuts moved back ahead of soybeans as the crops sales leader with \$367.7 million. Peanuts ranked second among all commodities with 10.8 percent of the total. Receipts from soybeans fell sharply from the record 1982 level totaling \$298.2 million and accounting for 8.8 percent of the total. Despite the sharp decrease, soybeans still ranked third among all commodities. Government payments, at \$82.2 million or 2.4 percent of the total, were 280 percent above 1982.

1983 FARM EXPENSES

For only the second time since 1968, total farm production expenses of Georgia farmers declined from the previous year. The reduction was due to reduced acreages primarily because of participation in the PIK program.

Production expenses in 1983 totaled \$2.93 billion, 2 percent less than the revised 1982 estimate of \$3.00 billion. Expense items showing the largest decrease were: seed cost, down 20 percent to \$79.5 million; hired labor, down 17 percent to \$193.2 million; and fertilizer and lime which totaled \$199.3 million, 11 percent below the \$224.9 million in 1982.

Feed continued as the largest expense item, accounting for 21 percent of the total. At \$620.8 million, feed also had the largest increase being up 6 percent from 1982. Miscellaneous items at \$616.5 million, were \$2.6 million less than 1982. Some of the items included as miscellaneous expenses are federal crop insurance, electricity, irrigation, pesticides, veterinary services, medicines and interest on production loans. Interest on the farm mortgage debt rose 4 percent from last year to \$259.8 million.

BALANCE SHEET FOR 1984

The balance sheet for Georgia farmers on January 1, 1984 showed total farm assets at \$16.84 billion, 3 percent below the \$17.28 billion a year ago. However, claims against assets were also down 2 percent totaling \$4.78 billion in 1984 compared to \$4.88 billion in 1983. This resulted in equity for 1984 dropping to \$12.06 billion from \$12.40 billion in 1983 and the lowest level since 1978. Real estate assets which accounted for 71 percent of total farm assets dropped 2 percent to \$12.02 billion. Decreases in inventory caused large drops in livestock, poultry and crop assets. Partially offsetting the drop in assets were increases in household equipment and furnishings and financial assets.

On the claim side, real estate debt was up 1 percent but CCC loans were down 58 percent. Non-real estate debt fell 3 percent.

PRICES RECEIVED BY GEORGIA FARMERS

Prices farmers received for steers and heifers averaged \$53.60 per hundredweight in 1983, up \$6.00 from 1982. During the first six months of 1983, slaughter cow prices were above 1982, but the last six months were below 1982 and the 1983 marketing year averaged \$37.60 per hundredweight. Calf prices in 1983, at \$54.60 per hundredweight averaged more than the 1982 marketing year average of \$53.10. Milk prices averaged \$14.50 per hundredweight for the marketing year, \$1.10 above the 1982 average of \$14.40. Milk cow prices averaged \$1,030 per head for the four quarters in 1983 compared to \$1,110 for 1982. Broiler prices rose to 27.0 cents per pound and other chickens averaged 16.0 cents, 4.0 cents more than in 1982. Prices for all eggs at 71.7 cents per dozen were 4.5 cents more than in 1982. On the negative side, hog prices in 1983 declined significantly from 1982 and averaged \$45.90 per hundredweight. This was \$6.00 less than the 1982 marketing year average.

Prices farmers received for most major crops produced in 1983 rose above the season averages of the 1982 crops. Peanuts and oats were the only crops that didn't show an increase in price for the 1983 crops. The season average price for the 1983 corn crop was \$3.70 per bushel compared to \$2.62 for the 1982 crop. Soybeans averaged \$7.70 per bushel, \$2.25 more than the average price of the 1982 crop. Peanuts, the State's leading cash crop, averaged 23.1 cents per pound for the 1983 crop, compared to 24.6 cents for 1982. Wheat prices averaged \$3.20 for the season, up 15 cents from 1982. Grain sorghum averaged \$5.75 per hundredweight, compared to \$3.66 for the 1982 crop. Rye prices rose 1 cent per bushel in 1983 to \$2.35 and oats were 11 cents lower for the 1983 crop at \$1.45 per bushel. Tobacco prices in 1983 increased 70 cents per hundredweight to \$180.30. Prices for peaches from the freeze damaged 1983 crop were up from the previous year to 25.1 cents per pound. Pecans averaged 62.9 cents per pound, down 0.8 cents from the 1982 season. The 1983 season average price for cotton lint was 67.1 cents per pound, 10.5 cents more than the 1982 price of \$6.6 cents.

PRICES PAID BY GEORGIA FARMERS

The average prices paid by Georgia farmers during 1983 for commodities and services were up slightly overall from 1982. Price declines were cited for fuels, seeds, fertilizers, feeder pigs, and broiler-type chicks while price changes for fencing materials and pesticides were mixed. The largest price increases occurred in the farm machinery sector where farmers paid 7 percent more in 1983 for new equipment than they did in 1982. Feed and building material prices were both up 4 percent from the previous year.

GENERAL

WEATHER AND CROP SUMMARY, 1983

Georgia's weather in 1983 commenced with wet soils and low temperatures. This combination of climatic conditions launched the later than usual planting season. The wet, soggy soils of March continued to delay planting progress, as did the wet and record low temperatures of April. For the second successive year, freeze damage to fruit crops was again heaviest in north Georgia. By the end of April, planting progress for all spring planted crops was still far behind normal. The more seasonal weather of May was more favorable for planting; however, many fields that were planted late reached development stages later than normal. Summer brought periods of dry and hot weather with rains the last part of July and early August and again around the 1st of September. The periods of rain brought 11th hour reprieves to peanuts in August and soybeans in September. The end of August brought dry and record-breaking hot temperatures which caused stress to crops, livestock and poultry. The rains and record breaking lows of December caused the need for more feed and care of livestock and poultry. Harvest of most crops was slow with soybean and pecan harvest lagging the most. Yields of most crops were average to above average. Rainfall for the year averaged 5.38 inches above normal but was very erratic and was especially short during the critical crop development months of May-August. Rainfall averaged 5.56 inches below normal during the May-August period. Temperatures for the year averaged 1.2 degrees below normal but were well above normal in July and August.

JANUARY

January commenced with temperatures well below normal and rainfall averaging 1.00 to 2.00 inches the first week. The colder than normal conditions prevailed virtually the entire month. The most severe weather was associated with an arctic air mass around the 19th, which dropped temperatures far below normal and brought sleet and freezing rain to much of the State. The average temperature statewide for January was 42.4 degrees, 3.1 degrees below normal. Precipitation for the State averaged 4.30 inches, .34 inches below normal. The below normal temperatures along with the snow, sleet and rain delayed land preparation in the southern third of the State. Livestock were rated in good condition.

FEBRUARY

February began with warmer than normal temperatures and heavy rains of 2.00 to 3.00 inches in the northern section of the State. From 1.00 to 2.00 inches fell in the central and southern portions. However, temperatures quickly returned to below normal levels and stayed that way for about two weeks. The weekend of the 12th and 13th brought temperatures that averaged nearly 10 degrees below normal. Soil moisture supplies continued mostly surplus. The last two weeks produced highly variable weather conditions. Field activities resumed in the drier areas toward the end of the month, but remained non-existent in wet areas. Land preparation and nitrogen topdressing of small grains were behind normal by the end of the month. Tobacco plants were rated in good condition. Precipitation during February averaged 5.71 inches, 1.18 inches above normal. Average temperature for the State was 47.3 degrees, 0.8 degrees below normal.

MARCH

March was another wet and cool month. The frequent rainfall kept soil moisture supplies deviating from surplus to adequate to surplus all month. Wet, soggy soils limited field activity all month and for the last two weeks the number of days suitable for fieldwork ranged from only 1 to 2 days per week. As a result, land preparation was far behind normal progress and planting of corn, tobacco and watermelons lagged far behind the previous year and the 5-year average. Peaches blooming or past blooming had reached about 80 percent by the end of the month but freeze damage was showing up in northern areas. By month's end, the State's wheat crop continued to show signs of stress from wet soils, disease and fertilizer deficiency. About three-fourths of the wheat was topdressed by the end of the month. The average temperature for the month was 53.9 degrees, 1.2 degrees below normal. Rainfall averaged 6.94 inches, 1.37 inches above normal.

APRIL

Wet and cold weather initiated the month followed by storms, gusty winds, fog and clouds. The 16th and 17th brought dry weather, but temperatures were approximately 10 degrees below normal statewide. Freezing temperatures reached well into the south on the 19th and 20th with statewide temperatures 12 to 15 degrees below normal. This was one of the coldest mid-April periods on record with freezing temperatures as far south as Plains and Claxton. Freeze damage to the apple and peach crops was heavy in the north. Wheat that was just heading in central counties was also heavily damaged. The adverse weather conditions sharply lowered crop condition ratings of corn, tobacco and watermelons. Freeze damage also occurred to vegetable crops. Emerged crops suffered from slow growth. More seasonal temperatures and drier weather by the end of the month enabled farmers to begin catching up on planting. However, the planting progress for all spring planted crops was still far behind the previous year and normal by the end of the month. Rainfall for the State averaged 3.59 inches, 1.39 inches above normal. Temperatures for the month were much cooler than normal averaging 58.6 degrees, 5 degrees below normal.

MAY

The first part of the month continued the pattern of more seasonal weather. It was generally fair and mild with scattered light rains through the first one-third of the month. Soil moisture supplies decreased to short and very short levels across much of central Georgia by the end of the second week. Farmers made rapid strides in planting progress but it wasn't until later in the month that plantings had about caught up with normal. Much of the southern two-thirds of the State was dry the last half of the month. Scattered showers provided temporary relief from the dry conditions but crop condition ratings were at the low point at month's end. Peach harvest got underway around the middle of the month in extreme south Georgia and progressed at about an average pace but still well behind 1982. Average precipitation for Georgia was a scanty 2.71 inches, 1.64 inches below normal. Temperatures for the State averaged 69.6 degrees, 1.2 degrees below normal.

JUNE

Spotty rains and mild to warm weather continued through the first week of June leaving much of the State very dry. However, a period of statewide rain the second week of June brought much needed moisture to most areas. Crop conditions improved following the rain. By mid-month, dry conditions had again returned and the condition ratings of most crops declined. Showers the latter part of June came at a critical time and crops again improved. Problems with weeds, insects and plant diseases increased with the warm, humid and showery weather the last part of the month and wet soils delayed harvest of tobacco and watermelons in some areas. Crop development at the end of the month continued well behind the previous year and average. Tobacco harvest at month's end was less than half the normal progress. Peach harvest was ahead of both last year and average due to the very small north Georgia crop which had been virtually destroyed by the April freeze. The average temperature for Georgia was 74.6 degrees, 2 degrees below normal. Precipitation averaged 4.53 inches, .22 inches above normal.

JULY

The weather pattern for July was hot, dry and humid with scattered thundershowers late in the month. The showers were most numerous in the south and southeast and fell mostly at the end of the month. Spraying for control of weeds, insects and disease, extra care of livestock and poultry and irrigating where available were the major activities. Crops were under stress due primarily to very low soil moisture supplies and very high temperatures which reached or topped 100 degrees over much of the State. Dryland crops were stressed to the point where some cotton was shedding bolls and blooms and peanuts quit blooming in some areas. Condition ratings for all crops dropped sharply. The high temperatures also stressed livestock and poultry and caused some above normal poultry mortality rates despite extra care. The last few days of the month brought general rain across extreme south and southeast Georgia. Precipitation for the month averaged 2.61 inches, 2.74 inches under normal. The average State temperature was 81.0 degrees, 1.6 degrees above normal.

AUGUST

Scattered showers and thundershowers continued early in the month. However, this was only temporary as dry weather returned a few days after the first of the month. The lowest soil moisture supplies of the season were recorded the week ending the 28th. This coupled with the record shattering hot weather for the week ending the 26th continued to deteriorate crop conditions. Foliage feeders and corn earworms were a problem in some soybean and peanut fields. Some farmers were forced to provide supplemental feed to cattle. The extreme heat continued to stress livestock and poultry with above normal death losses reported in poultry. Armyworm outbreak in pastures was common by mid-month which contributed to lower condition ratings. General rains the last few days of the month provided an 11th hour reprieve for much of the State's soybean crop. Corn harvest was over half completed by the end of the month but was still behind average. Peanut harvest got off to a slower than normal start. The August average temperature for Georgia was 81.2 degrees, 2.2 degrees above normal. Rainfall averaged 3.03 inches, 1.40 inches under normal.

SEPTEMBER

By the weekend of the 3rd, additional scattered showers and thunderstorms further improved soil moisture supplies. Late planted row crops, pasture and hay received the biggest boost from the rain. Soybeans continued to be sprayed for foliage and pod feeding insects. The mostly surplus soil moisture supplies, in much of the peanut belt, was a contributing factor to the slow digging and threshing pace of peanuts. Tobacco harvest was completed by the 25th. At the end of the month corn harvest was equal to normal progress but harvest progress for peanuts was far behind average. September ended with unseasonably cool and quite dry weather throughout the State. Precipitation averaged 4.82 inches, .67 inches above normal. Average temperature was 72.0 degrees, 2.3 degrees below normal.

OCTOBER

The first week of October was mild and dry. A strong cold front at mid-month brought 1.00 inch plus rainfall to north Georgia and the lowest temperatures of the season. Frost was common across north and portions of central Georgia the last week of October with freezing temperatures reported in the north Georgia mountains. Wheat plantings were ahead of 1982 but slightly behind the 5-year average. Peanuts were slow to reach maturity in many areas and, by the 30th, threshing was 9 percentage points below last year's progress. Cotton, soybeans and pecan harvest was also lagging far behind 1982 and the 5-year average. Corn harvest was about 3 percent away from completion. The average temperature for the month was 64.7 degrees, 0.9 degrees above normal. October rainfall averaged 2.07 inches, .53 inches below normal.

NOVEMBER

Soil moisture supplies dropped the first week of the month as it was generally mild and dry across Georgia. A number of cold fronts moved through the State during the last half of November bringing periods of heavy rain and cool temperatures. Most farms received four to seven inches of rain over the last two weeks with some local amounts over nine inches. The rain was helpful to pastures and small grains but continued to slow harvesting of late crops. Cotton harvest was 6 percentage points behind the 5-year average and soybean harvest was only three-fourths complete by the end of the month. Pecan harvest was 22 percentage points behind that of the previous year and 17 percentage points behind the average. Late maturity and inclement weather were the cause of the great lag in pecan harvest. The average rainfall for November was 6.32 inches, 3.54 inches above normal. Temperatures in the State averaged 53.8 degrees, 0.3 degrees below normal.

DECEMBER

Temperatures for the month averaged two to five degrees below normal across most of Georgia. However, temperatures ranged from above normal early in the month to record breaking lows over the Christmas holiday period. The highest temperature reported was 81 degrees at Bainbridge and Brunswick while the lowest reported temperature was -8 degrees at Blairsville. December was a wet month with most rainfall totals in the five to ten inch range. Some northeast Georgia stations reported over ten inches of rain. The rains continued to slow farm activities. Harvest of soybeans and pecans continued at a slow pace and trailed progress of last year and average. Small grains survived the record breaking cold in most areas but freeze back and some freeze kill occurred. Tobacco bed preparation got underway by mid-month. More feed and care was necessary for cattle, chickens and hogs due to the record low temperatures but death losses were minimal. Onions were hard hit by the record breaking cold and many fields were lost. Temperatures for the month averaged 43.9 degrees, 3.3 degrees below normal. Precipitation averaged 7.84 inches, 3.66 inches above normal.

1/ Quarterly estimates discontinued after April 1981. 2/ Excludes agricultural service workers. 3/ Includes as "other family" only those household members working 15 hours or more per week without receiving cash wages.
4/ Insufficient data for this category.

FORESTRY

The following table contains information gathered and compiled by the Georgia Forestry Commission covering the value of sales of all forest products at first point of sale. This information is included in this publication because of the lack of comparable information and the interest for such information.

The estimating program of the Georgia Crop Reporting Service does not cover forestry items. Only an end of year appraisal is made for cash farm receipt purposes of the sale of forestry products by individuals and firms defined as farms. These data are shown in the table on page 64.

GEORGIA ANNUAL HARVEST FOREST PRODUCTS VALUE AT FIRST POINT OF DELIVERY

Southern Yellow Pine Pulpwood, 1982 <u>1/</u>	\$ 385,990,800
Southern Yellow Pine Sawtimber, 1980	\$ 288,320,000
Firewood, 1981	\$ 135,614,720
Southern Yellow Pine Veneer, 1980	\$ 45,360,000
Hardwood Pulpwood, 1982	\$ 36,688,520
Hardwood Sawtimber, 1980 <u>1/</u>	\$ 33,972,000
Pine Stumps, 1980	\$ 21,255,000
Whole Tree Chips, 1981	\$ 18,348,372
Southern Yellow Pine Poles, 1980	\$ 14,575,000
Hardwood Veneer, 1980	\$ 10,465,000
Christmas Trees, 1983	\$ 4,706,000
Naval Stores, 1982	\$ 2,855,035
Southern Yellow Pine Posts, 1980	\$ 1,632,050
Miscellaneous <u>2/</u>	\$ 3,080,000
Total Value	\$ 1,002,862,497

1/ Includes chips produced for pulping. 2/ Includes cypress posts, locust posts, split rail post, etc; pine straw; and forest seed.

ESTIMATES ISSUED BY GEORGIA CROP REPORTING SERVICE

Current estimates of many data items included in this publication are available from the Georgia Crop Reporting Service at various times throughout the year. The table below indicates the months data are available. Current data may be obtained by calling the Crop Reporting Service or interested persons may be added to one or more of our five mailing lists. The five separate mailing lists are: (1) Weekly Weather and Crops, (2) Weekly Broiler Report, (3) Georgia Agricultural Facts, (4) Georgia Poultry Facts and (5) Georgia Farm Report, a semi-monthly publication containing various crop, livestock, price and other farm data. The annual charge for these publications is: Weekly Weather and Crops, \$12; Weekly Broiler Report, \$15; Georgia Agricultural Facts, \$5; Georgia Poultry Facts, \$5, and Georgia Farm Report, \$10. Reports are available free of charge to farmers and agribusiness firms who provide the basic data on which reports are based. Within availability constraints, a copy of the Georgia Agricultural Facts and Poultry Facts is available to Georgia residents without charge. An order form may be obtained by calling (404-546-2236) or writing the Georgia Crop Reporting Service.
